No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Recombinant single chain anti-disialoganglioside GD2 antibody - useful detect tumour cells expressing GD2 and to target therapeutic agents, e toxins, to such cells.

9.6

Disclosure; Page 11; 31pp; English.

The present sequence encodes a recombinant single chain peptide, 5F11-scFv. The peptide is an antibody construct comprising the variable regions of the heavy and light chains of an antibody against dislaloganglioside (GD2) as a single chain Fv fragment (scFv). GD2 occuin many tumours types including neuroblastoma, osteosarcomas and other soft tissue sarcomas, medulloblastomas, high grade astrocytomas, GD2 occurs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 melanomas and small cell lung cancer. The peptide can be detectably labelled, preferably with 99m-Tc, for tissue imaging of cells expressing GD2. It can also be used to target delivery of a therapeutic or pretherapeutic agent, such as a toxin, streptavidin or a pro-drug converting enzyme, to cells expressing GD2. The peptide may further comprise CD8 to facilitate the formation of GD2-targeted lymphocytes. T cells containing
           Anti-disialoganglioside GD2 single chain antibody 5F11 scFv

New fusion protein, useful for inducing host immune response, comprises variable region of light chain of an antibody linked to variable region of antibody, CD28 receptor signaling domain and transmembrane domain.

Disclosure; Page 3; 9pp; English.

the construction of the present 5F11 scFv gene using a mouse scFv module/recombinant phage antibody system. The scFv can be used in fusion proteins of the invention which comprise an scFv antibody linked to the human T cell surface receptor CD28. T cells expressing such fusion proteins exhibit enhanced survival when reintroduced to an in vivo environment. They can be used to induce an immune response to cells that express the antigen to which the antibody is specific. Cells expressing a fusion protein including an anti-GD2 scFv are useful for treatment of melanomas, neuroblastomas, small lung carcinoma, sarcomas and brain tumours that express GD2 as a surface antigen. Cells expressing the fusion proteins of the invention can also be used for in vitro purging of stem cells or bone marrow and for in vivo targeting of tumour cells and The present sequence is that of cDNA encoding a single chain scFv antibody that is derived from an anti-disialoganglioside GD2 antibody produced by SF11 hybridoma cells. The scFv comprises the SF11 variable chains in VH-VL orientation. mRNA from SF11 hybridoma cells was used in antigen-bearing cells for imaging Ģ,

detect tumour cells expressing GD2 toxins, to such cells. and to target therapeutic agents, e.g

Page 12; 31pp; English

The present sequence encodes a recombinant single chain peptide, 5F11scrv-streptavidin. The peptide is an antibody construct comprising the
variable regions of the heavy and light chains of an antibody against
disialoganglioside (GD2) as a single chain Fv fragment (scFv). GD2 occurs
in many tumours types including neuroblastoma, osteosarcomas and other
soft tissue sarcomas, medulloblastomas, high grade astrocytomas,
melanomas and small cell lung cancer. The peptide can be detectably
labelled, preferably with 99m-TC, for tissue imaging of cells expressing
GD2. It can also be used to target delivery of a therapeutic or pretherapeutic agent, such as a toxin, streptavidin (e.g. present sequence)
or a pro-drug converting enzyme, to cells expressing GD2. The peptide may
further comprise CD8 to facilitate the formation of GD2-targeted
characterian therapeutic calls containing the peptide can also be used to target GD2-producing tumour cells

                                                                                                                                                                                                                                                   This sequence encodes scFv 508F heavy chain, linker and light chain. The CC scFv fragment was derived from the 508 IgM hybridoma which is generated cC from splenocytes of a mouse that has been immunised with a peptide CC corresponding to the 16 amino terminal residues of beta-Ap conjugated to CC keyhole limpet hemocyanin used a carrier. The resultant variable chain CC fragments may be used in the method of the invention. Cys 96 of the VL CC fragment was replaced with various amino acids to see if production yield CC or stability were effected without having an adverse effect on its CC binding affinity. The invention provides an agent for treating a plaque CC vehicle and are capable of eliciting antibodies capable of disaggregating CC the aggregating protein and/or of preventing aggregation of the CC aggregating protein and/or of preventing aggregation of the CC disease, late onset Alzheimer's diseases, e.g. early onset Alzheimer's CC disease, SAA amyloidosis, hereditary Icelandic syndrome, senility, CC multiple myeloma, scrapie, bovine spongiform encephalopathy (BSE), kuru, CC (GSS) and fatal familial insomnia (FFI)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a method for treating a neurological disease or a central nervous system (CNS) disorder. The method involves displaying a therapeutic molecule capable of treating the neurological disease or CNS disorder on a viral display vehicle. The viral display vehicle is then introduced, into the oliactory system of a subject to treat the disease or disorder. The method of the invention is useful for preventing, treating and disgnosing neurological diseases or CNS disorders, such as:
Alzheimer'd disease; Creutzfeld-Jakob disease; Huntington's chorea; viral infections of the brain; brain tumours; lysosomal storage diseases; Parkinson's disease; and multiple sclerosis. The present DNA sequence represents a gene which was used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating or diagnosing neurological diseases of the central nervous system, e.g. Alzheimer's disease, comprises displaying a polypeptide or diagnostic agent on viral display vehicle and introducing or detecting the display vehicle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          646;

Treating ne displaying display veh ing therapeutic vehicle which i neurological disease CNS e.g., Alzheimer's disease, by ng therapeutic molecule capable of treating the disease on viral vehicle which is then administered to subject through olfactory

Example 2; SEQ Ħ ĕ <u>ن</u> 68pp; English.

The invention relates to a method of treating a neurological disease of disorder of the central nervous system (CNS). The method involves displaying a therapeutic molecule capable of treating the neurological disease or disorder of the CNS on a viral display vehicle and introductiviral display vehicle into a subject by applying an effective amount of the viral display vehicle displaying the therapeutic molecule to an introducing amount of õ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      olfactory system of the subject. The method is useful for treating a neurological disease or disorder of CNS such as a plaque-forming disease such as Alzheimer's disease, late onset Alzheimer's disease, late onset Alzheimer's disease, presymptomatic Alzheimer's disease, SAA amyloidosis, hereditary Icelandic syndrome, senility, multiple myeloma, scrapie, bovine spongiform encephalopathy (BSE), kuru, Creutzfeldt-Jakob disease (CUD), Gerstmann-streussler-Sheinker disease (GSS) or fatal familial insomnia (FFI). The method is also useful for treating a non plaque forming disease or disorder e.g. Huntington's chorea, viral infections of the brain, brain tumours, lysosomal storage diseases which cause neurodegeneration and are manifested by enzyme deficiencies and multiple sclerosis. The invention is also used in the preparation of vaccines. The present sequence is human beta amyloid peptide (beta AP) antibody heavy chain DNA. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Local Similarity

                                                                                                                                                                          tumour is a primary or a metastasized tumour such as carcinoma of the bladder, breast, cervix, colorectum, lung, ovary, pancreas, prostate, stomach, cholangiccarcinoma, gastric sarcoma, glioma, lymphoma, melanoma, multiple myeloma, osteosarcoma, head and neck tumor and solid tumor. The method of the invention is useful for X-ray-guided delivery of a therefore the invention, a diagnostic composition or their combinations to a tumour in a subject. The current sequence represents a single chain antibody encoding sequence that was identified following in vivo panning to irradiated tumours. This antibody binds platelet membrane glycoprotein
                                                                                                                                                                                                                                                                                                                      The invention relates to a method for identifying a molecule that binds an irradiated tumour in a subject. The method of the invention involves exposing a tumour to ionizing radiation, administering a library of diverse molecules to a subject, and isolating one or more molecules of the library from the tumour. The method of the invention is useful for identifying a molecule that binds an irradiated tumour in a subject e.g. warm-blooded vertebrate and human, and also for tumour detection. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying molecule that binds to irradiated tumor in a subject, exposing tumor to ionizing radiation, administering library of dimolecules and isolating library molecules from tumor to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cervix; colorectum; lung; ovary; pancreas; prostate; stomach; cholangiocarcinoma; gastric sarcoma; glioma; lymphoma; melanoma; multiple myeloma; osteosarcoma; head; neck; radiation; x-ray; gene;

CC The invention relates to a method for screening phage-displayed CC antibodies binding to radiation-inducible neoantigen on cell. The method CC involves contacting cell with antibodies, treating cell with radiation, CC contacting cell with antibodies not binding to cell and detecting the CC contacting cell with antibodies not binding to cell and detecting the CC displayed antibodies for an ability to bind to a radiation-inducible CC neoantigen present on a cell, where the cell is tumour cell chosen from CC benign intracranial meningiomas, arteriovenous malformation, angioma, CC macular degeneration, melanoma, adenocarcinoma, malignant glioma, CC carcinoma, thyroid carcinoma, bladder carcinoma, pancreatic CC carcinoma, brain carcinoma, liver carcinoma, colon carcinoma, rectal CC carcinoma, solid tumours, solid tumour metastases, angiofibromas, CC carcinomas, solid tumours, solid tumour metastases, angiofibromas, cC carcinomas and their combinations or vascular endothelial cell. The present sequence is a DNA encoding single chain variable fragment (scFv) antibody that binds to radiation-inducible neoantigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      28-APR-2000;

Claim 1; Fig 2; 18pp; German.

This invention describes a novel cell-targeting vector (A) containing a CC DNA sequence (I) encoding a single-chain variable antibody fragment (C (scFv). The products of the invention have antivital, cytostatic and cimmunostimulant activity and can be used in gene therapy, immunization CC and diagnosis particularly of T cell-associated diseases, specifically C acquired immune deficiency syndrome (AlDS), severe combined immune CC deficiency (SCID) or T cell lymphoma. (A) target T cells, independently of the CD4 receptor, with high selectivity, 4-5 fold selectivity over CC designated 7A5 encodes a 329 amino acid single-chain variable antibody CC fragment, fully defined in the specification. It was used to transform CC (SNV)) cells, CB166 (human T lymphocyte) cells, and HeLa (human cervical carcinoma) cells. After 48 hours, the cells were stained with X-gal to CC determine transformation. The viral titer (infectious units/ml) was over CC inillion for D17, inillion for CB166 but less than 100 for HeLa, CC SNV-env leader/human K6-scFv fusion construct used in the construction of CC convel cell targeting vectors described in the invention. (Updated on 11-cx CC SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
The invention relates to a method for screening phage-displayed antibodies binding to radiation-inducible necentiagen on cell. The method involves contacting cell with antibodies, treating cell with radiation, contacting cell with antibodies not binding to cell and detecting the bound antibody. The method is useful for screening several phage-in the contacting cell with antibodies not binding to cell and detecting the contacting antibody. The method is useful for screening several phage-in the contacting present on a cell, where the cell is tumour cell chosen from the contacting intracranial meningioma, arteriovenous malformation, angioma, compared the contacting antibody. The method is useful for screening several phage-in contacting intracranial meningioma, arteriovenous malformation, angioma, compared to grostatic carcinoma, kidney carcinoma, bladder carcinoma, pancreatic corrections, thyroid carcinoma, lung carcinoma, bladder carcinoma, pancreatic corrections, brain carcinoma, liver carcinoma, breast carcinoma, ovary carcinoma, solid tumours, solid tumour metastases, angiotibromas, corrected corrected fibroplasias, haemangiomas, Kaposi's sarcoma, head and neck carcinomas and their combinations or vascular endothelial cell. The correct carcinoma is a DNA encoding single chain variable fragment (scFv) cantibody that binds to radiation-inducible neoantigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    28-APR-2000;

Also described:
(1) a recombinant nucleic acid comprising at least one sequence selected from the group consisting of ADC79233, ADC79235, ADC79235, ADC79236, ADC79238; (2) a vector comprising the recombinant nucleic acid; (3) a host cell; (4) a pharmaceutical composition; (5) preventing or treating CA 125 tumour antigen-associated disease in a mammal; and (6) negatively modulating a CA 125 tumour antigen in a mammalian cell. A modulator capable of negatively modulating a CA 125 tumour antigen in a mammalian cell. A cytostatic activity, and can be used in gene therapy. The modulator, recombinant nucleic acid, vector or host cell can be used for preparing a composition for preventing or treating CA 125 tumour antigen-associated disease in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   11-MAR-2002; 2002US-0363306P.

Ś 밁 8

The invention relates to a method for identifying a molecule that binds an irradiated tumour in a subject. The method of the invention involves exposing a tumour to ionizing radiation, administering a library of diverse molecules to a subject, and isolating one or more molecules of the library from the tumour. The method of the invention is useful for identifying a molecule that binds an irradiated tumour in a subject e.g. warm-blooded vertebrate and human, and also for tumour detection. The

The method of the invention is useful for X-ray-guided delivery of a theorem tion, a diagnostic composition or their combinations to a tumour in a subject. The current sequence represents a single chain antibody encoding sequence that was identified following in vivo panning to irradiated tumours. This antibody binds P-selectin

                                                                                                                                                                                                                                                         cell.
```

The invention relates to a method for screening phage-displayed CC antibodies binding to radiation-inducible neoantigen on cell. The method CC involves contacting cell with antibodies, treating cell with radiation, CC contacting cell with antibodies not binding to cell and detecting the CC bound antibody. The method is useful for screening several phage-cC displayed antibody. The method is useful for screening several phage-cC neoantigen present on a cell, where the cell is tumour cell chosen from CC benign intracranial meningiomas, arteriovenous malformation, angioma, CC macular degeneration, melanoma, adenocarcinoma, malignant glioma, CC prostatic carcinoma, kidney carcinoma, bladder carcinoma, pancreatic carcinoma, thyroid carcinoma, liver carcinoma, breast carcinoma, ovary CC carcinoma, boild tumours, solid tumour metastases, angiofibromas, cretal cretrolental fibroplasias, haemangiomas, Kaposi's sarcoma, head and neck CC carcinomas and their combinations or vascular endothelial cell. The CC carcinomas and their combinations or vascular endothelial cell. The CC carcinoma is a DNA encoding single chain variable fragment (scFv) cantibody that binds to radiation-inducible neoantigens.

The present sequence is a DNA encoding anti-hepatitis B surface antigen (4C2) scFv. It can be fused upstream of the DNA encoding light chain constant region of mouse antibody 1C3 or other gene of interest in a DNA construct, for ribosome display. The DNA construct is generated for producing replicable mRNA molecules that are used in continuous cyclic process of replication, mutation, and translation leading to continuous in vitro evolution (CIVE) of mutant proteins. This method is useful for generating proteins with improved diagnostic and therapeutic properties mutation, synthesis
